ROLL NO: 240701510

LAB EXERCISE 07

ROLE HIERARCHY AND MODULE PERMISSION CONFIGURATION FOR A HOSPITAL APPLICATION

Aim

To examine role-based access control in Zoho Creator by creating a hospital application's role hierarchy and configuring module permissions for its different user groups.

Procedure

1. Launch the Hospital Management System application in Zoho Creator and review its dashboard and reports.
2. Navigate to Settings → Users and Permissions → Permissions to manage access profiles.
3. Set module permissions for the required hospital forms, such as Admission, Appointment, Billing, Patient, Prescription, Medicine and Room.
4. Move to the Roles page and establish the organizational reporting structure.
5. Add the roles Admin, Doctor, Nurse/Staff, Receptionist, Pharmacist and Patient with their corresponding reporting relationships.
6. Assign the appropriate permission profile to each role and restrict unrelated application modules.
7. Save the role and permission changes, then verify the configured access for the user categories.

Overview

Role management organises users into a reporting structure, while permission profiles determine what each group can do inside the application. In this exercise, the hospital roles are created first and the module-level access settings are reviewed for areas such as patient records, appointments, admissions, billing, medicines and prescriptions.

Output / Screenshots

The following figures reproduce the application screenshots supplied in the reference practical. They are included as source illustrations and have not been edited to change the account identity displayed within them.

1. Reviewing the Administrator Role

The administrator is the highest role in the hierarchy and is described as having broad access to application records and administrative functions.

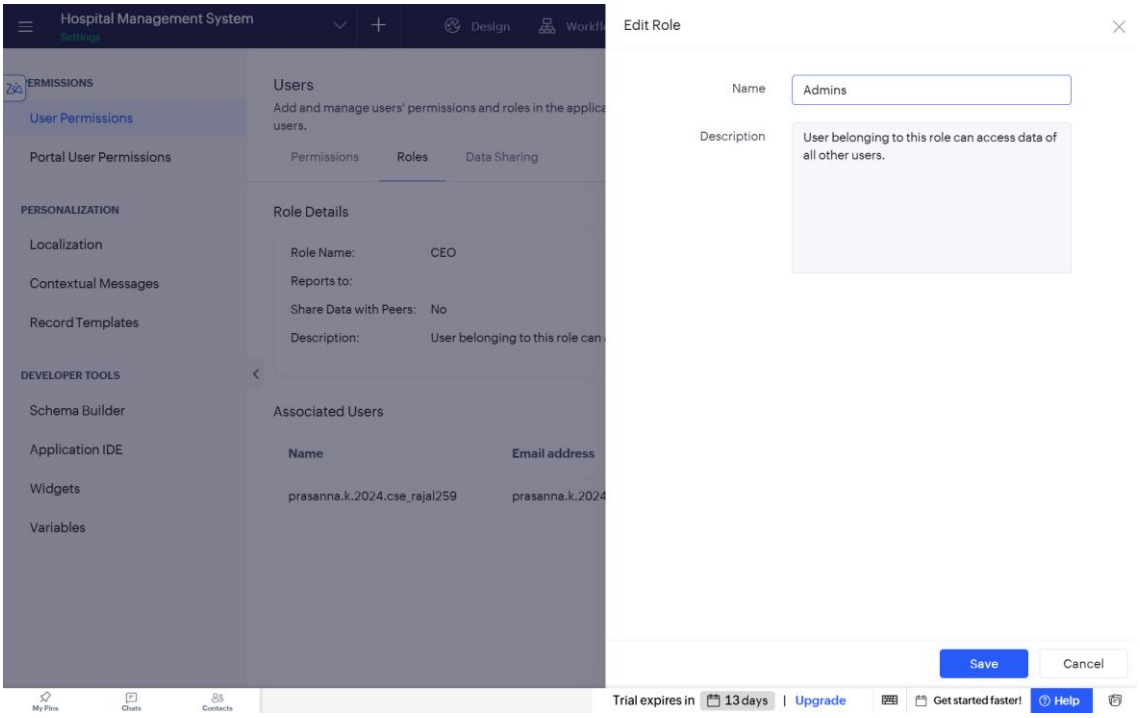

Figure 1: Reviewing the Administrator Role

2. Adding a Doctor to the Role Structure

A Doctor role is created as a child of Admin. This role is intended for clinicians who handle medical and patient information.

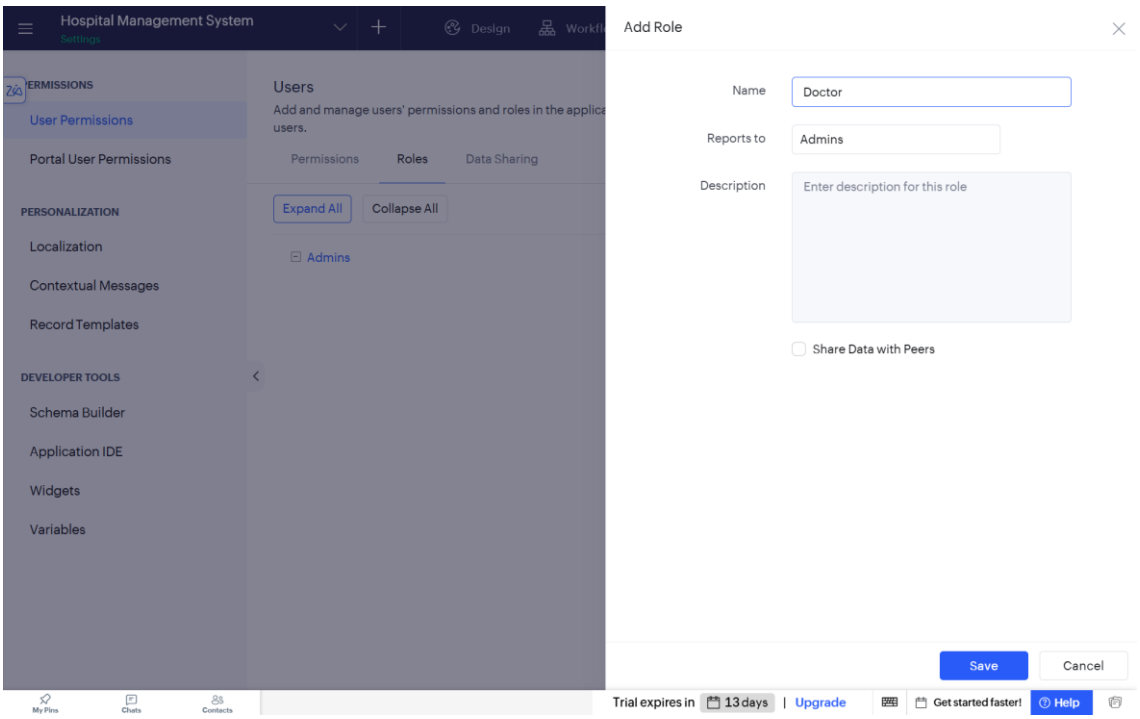

Figure 2: Adding a Doctor to the Role Structure

3. Setting Up the Receptionist Role

The Receptionist role is also placed below Admin. Its described responsibilities cover the front desk, appointment scheduling, admissions and billing.

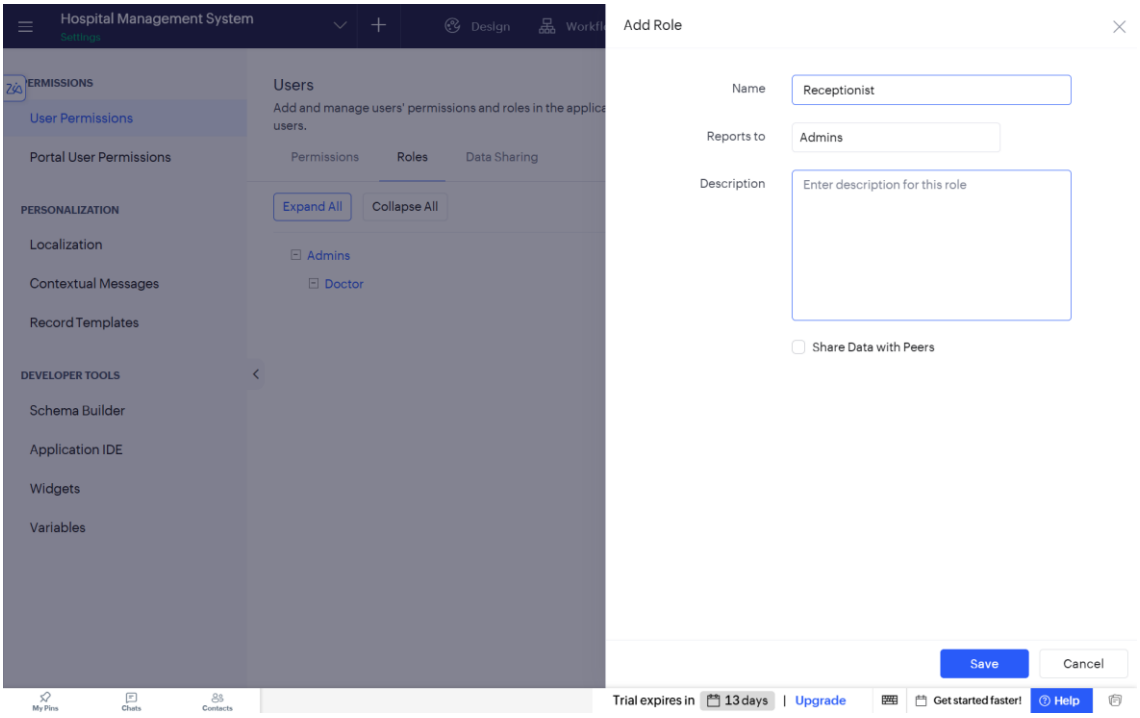

Figure 3: Setting Up the Receptionist Role

4. Adding the Pharmacist Role

A separate Pharmacist role is created for work involving medicine records and prescriptions, with Admin as its reporting level.

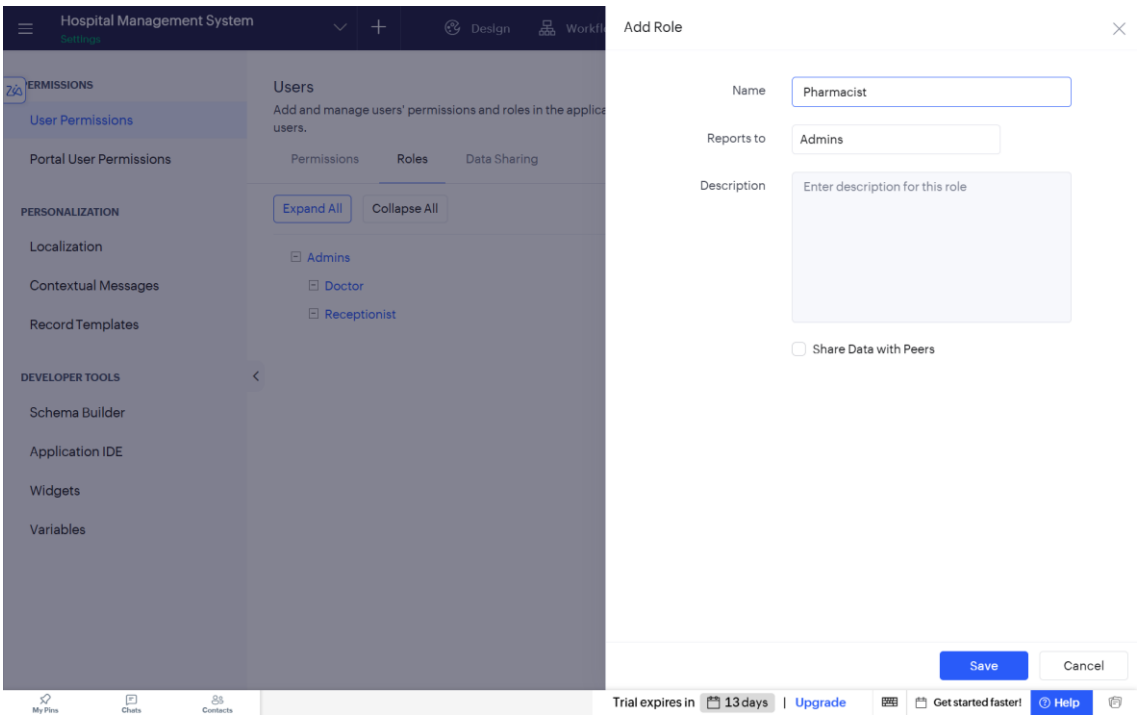

Figure 4: Adding the Pharmacist Role

5. Defining the Nurse and Staff Relationship

The Nurse/Staff role is linked to Doctor in the reporting hierarchy, as illustrated in the role-creation screen.

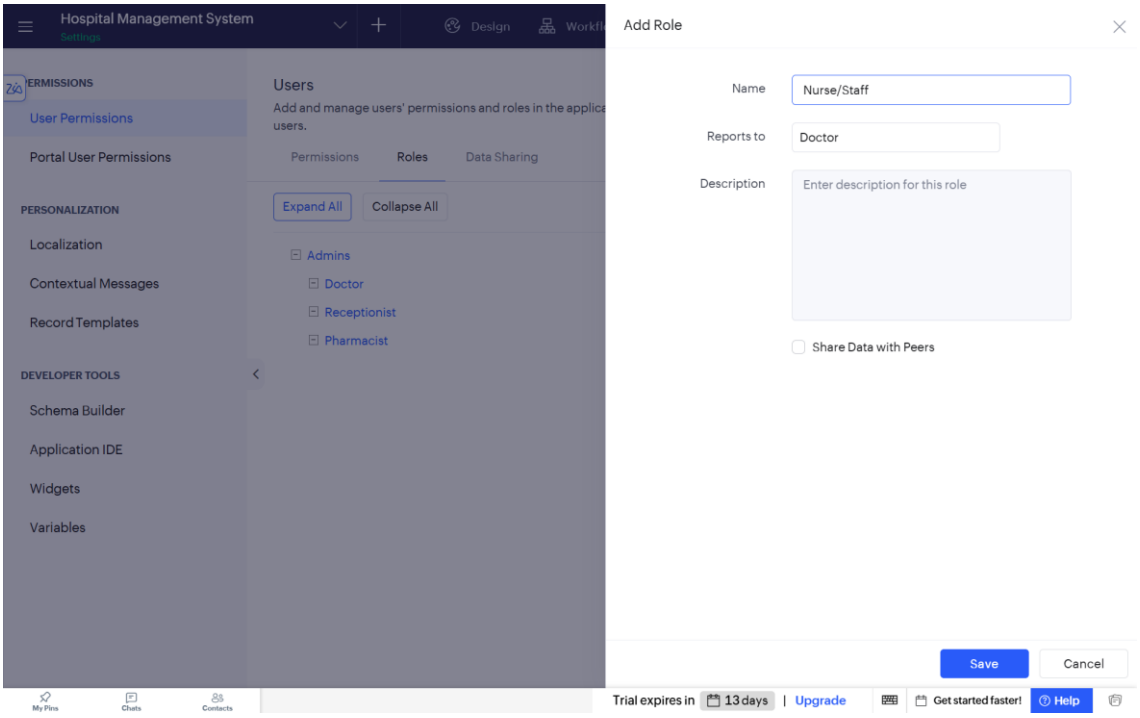

Figure 5: Defining the Nurse and Staff Relationship

6. Adding the Patient Role

The Patient role is added with Receptionist shown as its reporting role. This preserves the reporting arrangement in the provided practical.

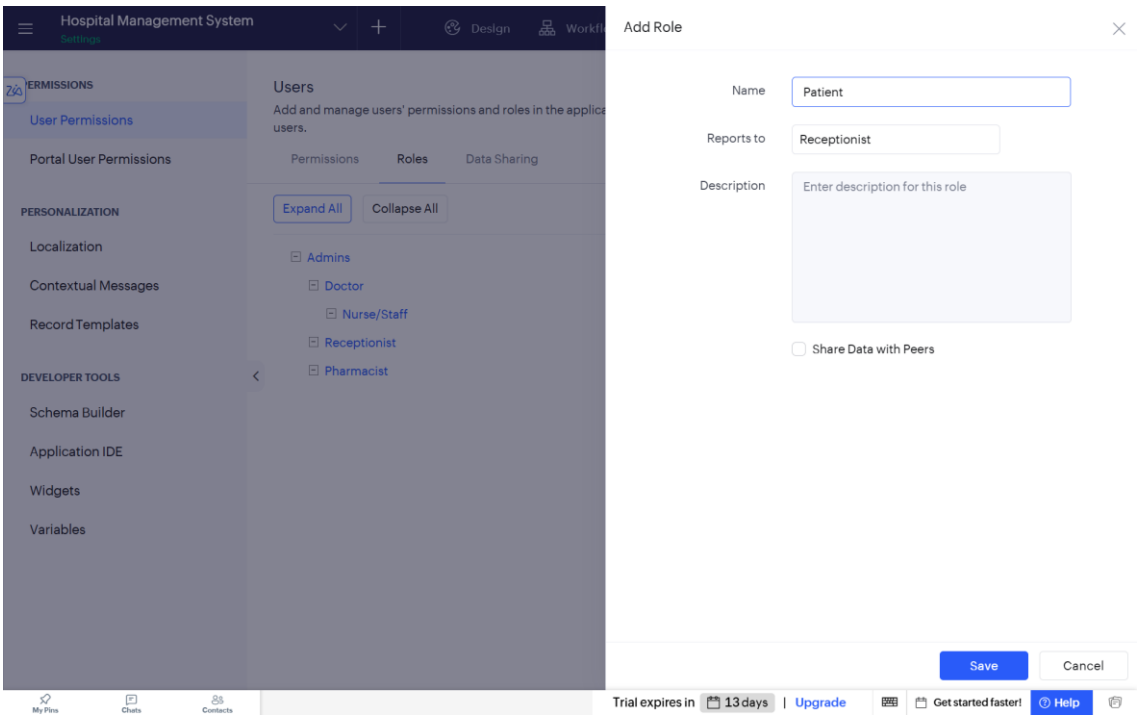

Figure 6: Adding the Patient Role

7. Inspecting the Role Hierarchy

The hierarchy view provides a consolidated picture of the defined roles and their reporting connections within the Hospital Management System.

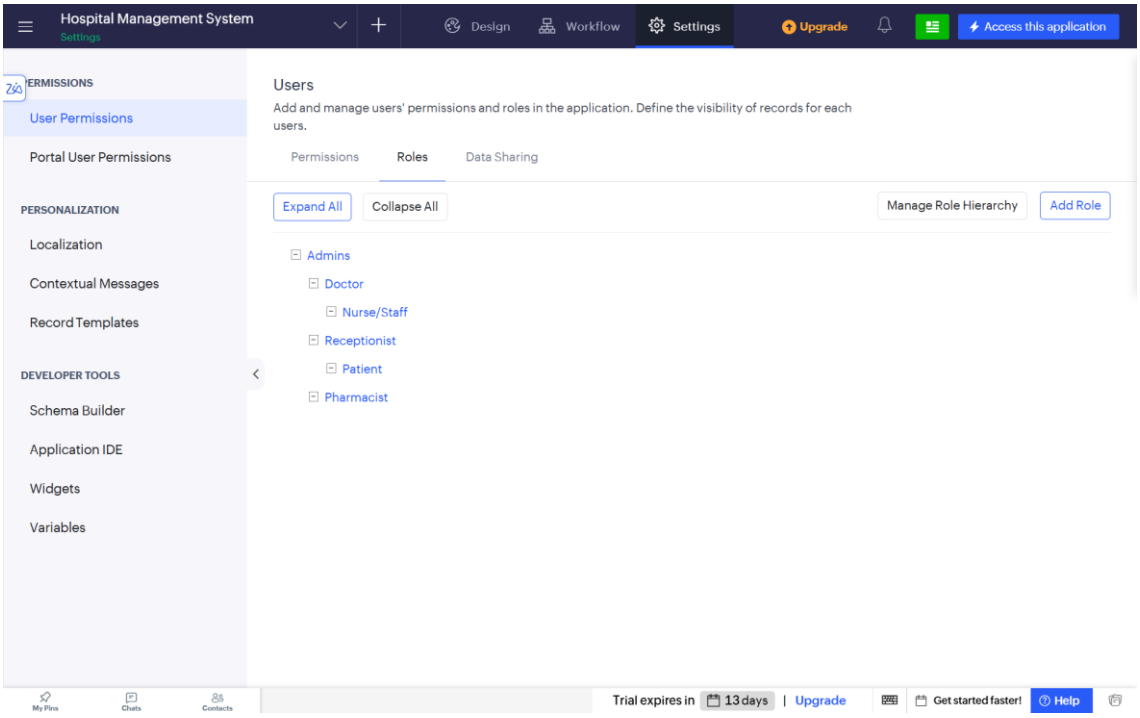

Figure 7: Inspecting the Role Hierarchy

8. Understanding a Permission Profile

Permission profiles describe the access rules that can be applied to users. The screen shows profile details and the module permissions included in the configuration.

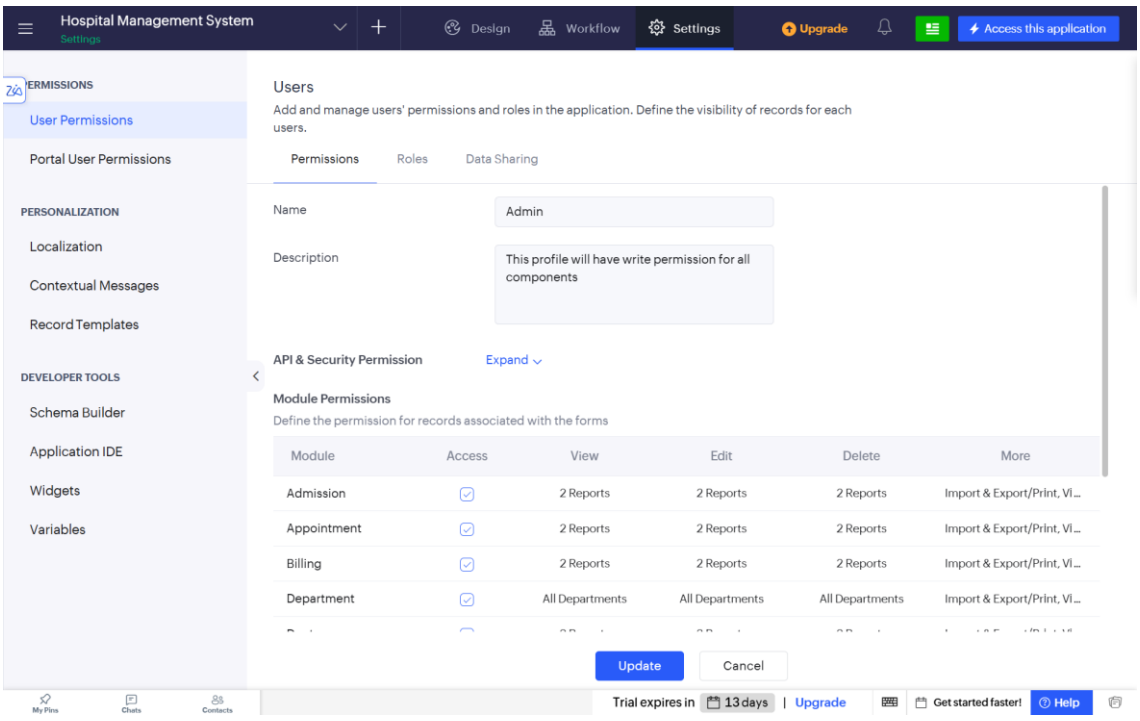

Figure 8: Understanding a Permission Profile

9. Setting Access for Admission, Appointment and Patient Records

This configuration screen illustrates selective permissions for three key areas: admissions, appointments and patient information.

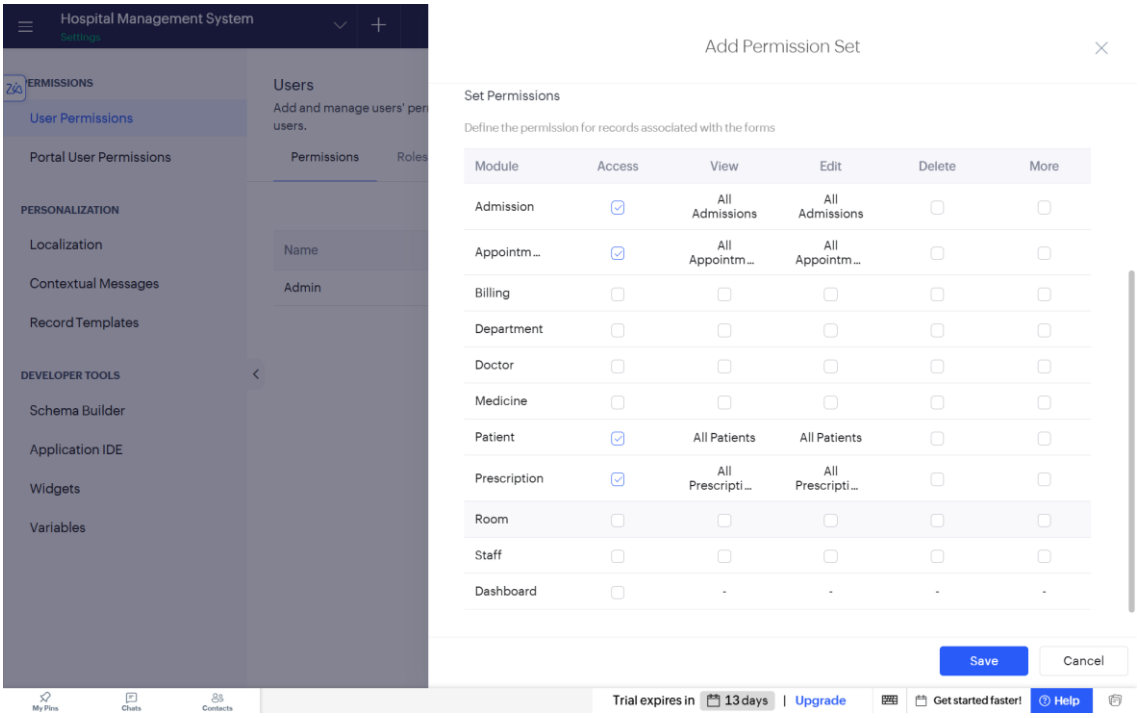

Figure 9: Setting Access for Admission, Appointment and Patient Records

10. Applying Appointment and Patient Permissions

The next settings view continues the configuration for appointment and patient records, while leaving other application areas restricted where they are not required.

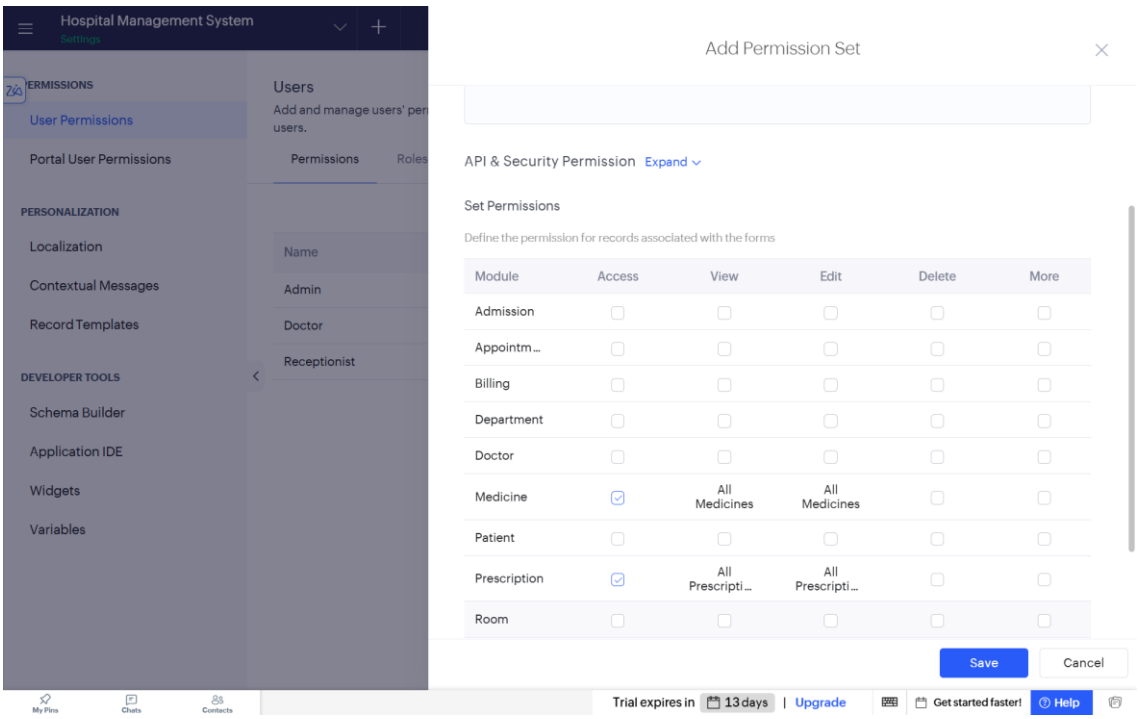

Figure 10: Applying Appointment and Patient Permissions

11. Applying Medicine and Prescription Permissions

The Medicine and Prescription modules are configured with access options for the role that is responsible for medication-related work.

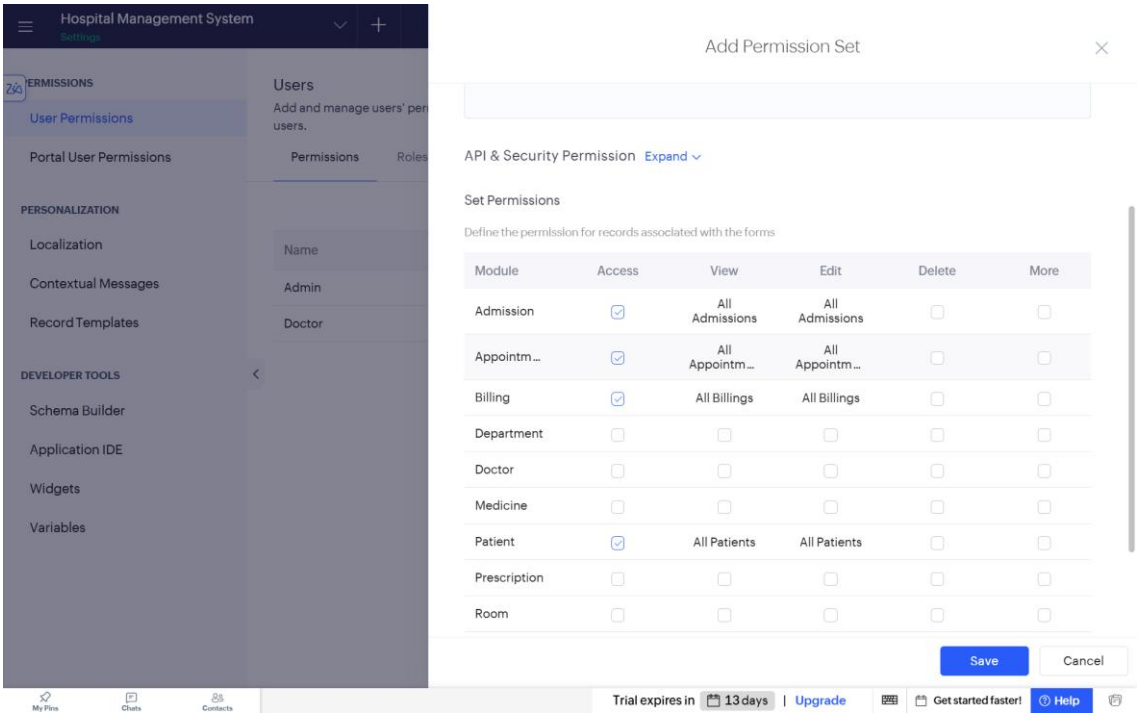

Figure 11: Applying Medicine and Prescription Permissions

12. Completing the Remaining Module Settings

Additional hospital modules are reviewed so that the access profile covers only the functions needed by the relevant user role.

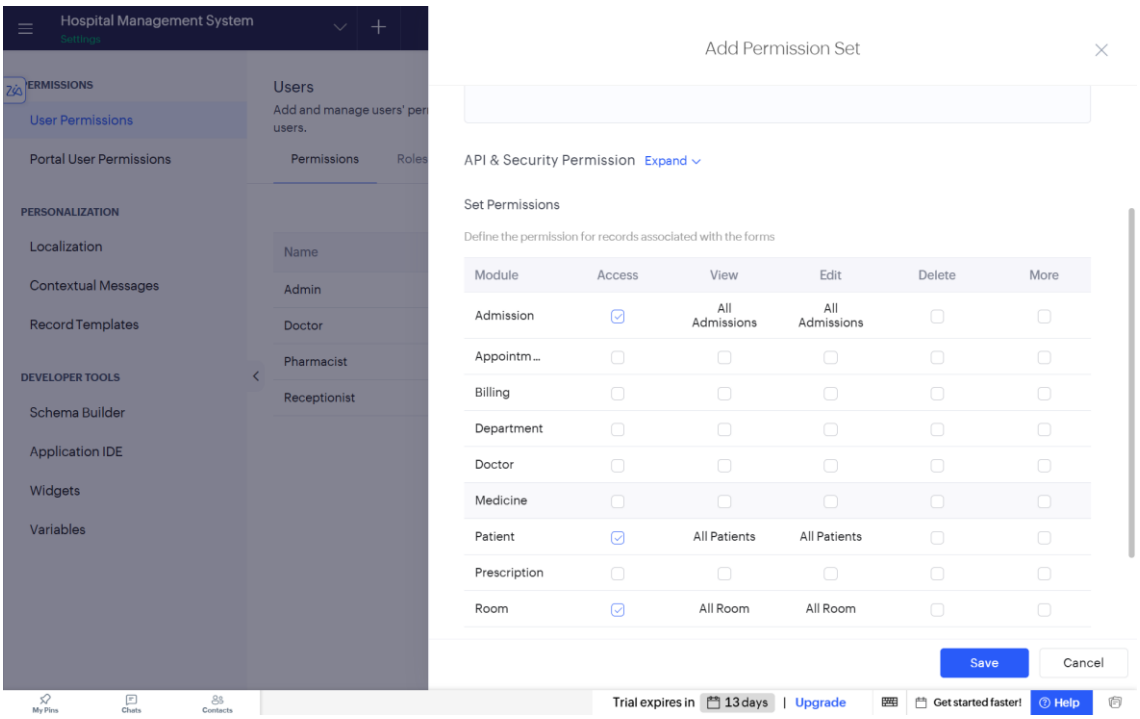

Figure 12: Completing the Remaining Module Settings

13. Finalising Module-Level Rules

The module permission table is used to set access and viewing rights for modules such as admissions, appointments, billing and prescriptions.

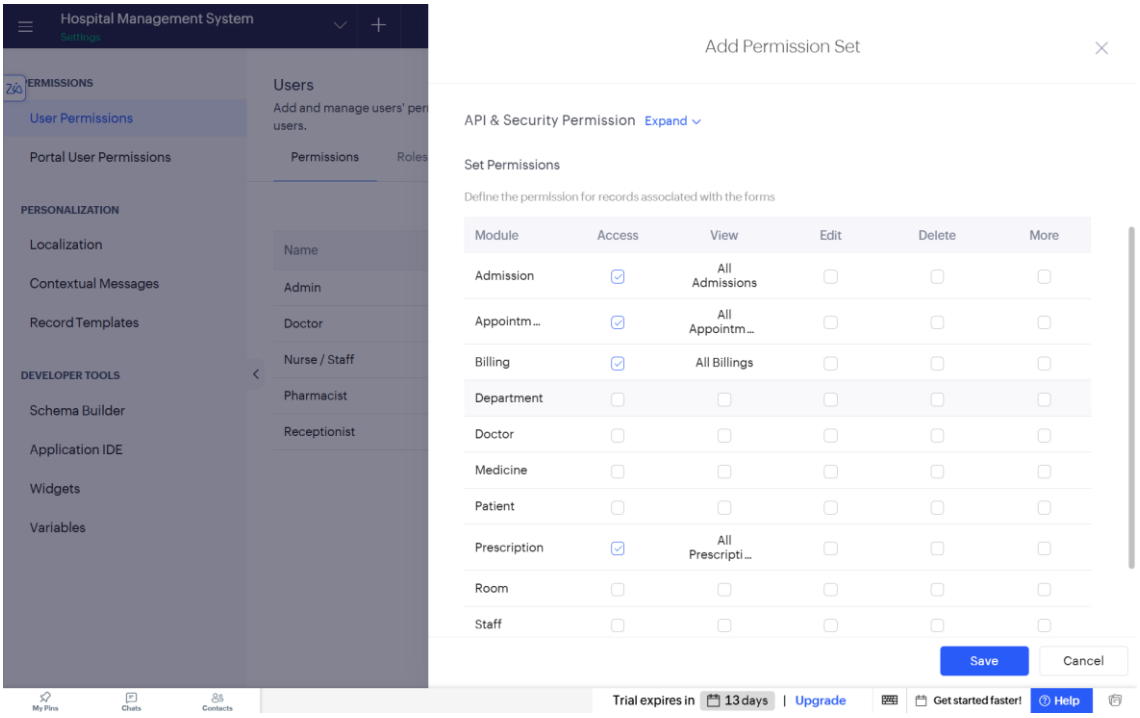

Figure 13: Finalising Module-Level Rules

14. Reviewing the Available Permission Profiles

The permission-profile list displays the separate access profiles configured for the different user categories in the application.

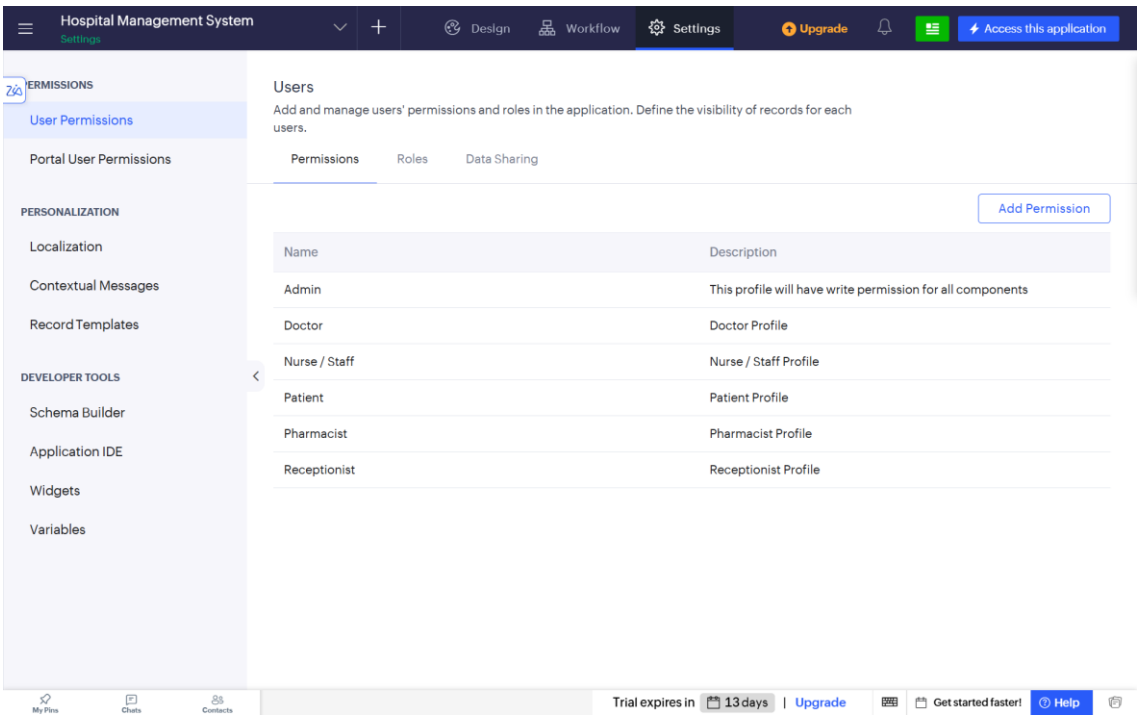

Figure 14: Reviewing the Available Permission Profiles

15. Viewing Dashboard Metrics and Reports

The dashboard presents summary cards, appointment statuses, shortcuts and graphical reports, giving users a high-level view of hospital activity.

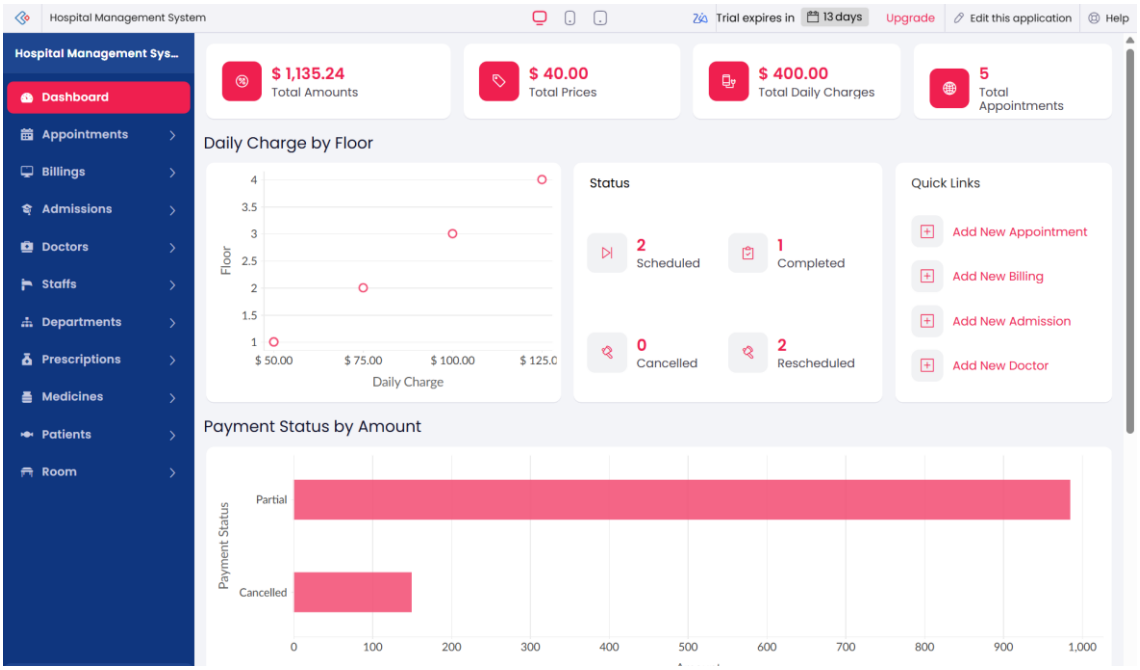

Figure 15: Viewing Dashboard Metrics and Reports

16. Checking the Dashboard and Appointment Records

The final view shows the application dashboard together with the All Appointments report, confirming the presence of operational records.

Figure 16: Checking the Dashboard and Appointment Records

Conclusion

This exercise shows the use of role-based management in Zoho Creator for a Hospital Management System. Separate user roles are arranged in a reporting hierarchy and permission profiles are used to determine which modules each category of user can access or modify.
