LAB EXERCISE 3
BUILDING A HOSPITAL MANAGEMENT APPLICATION THROUGH ZOHO CREATOR ZIA

Aim

To use the Zia AI App Builder in Zoho Creator to generate a hospital application from a written requirement and inspect the generated modules, data model, dashboard and appointment reports.

Procedure

Launch Zoho Creator and navigate to the Zia App Builder. Enter the required hospital application description, covering the modules to be included and the roles that will use the system. Review the suggested use cases and entity structure before creating the app. Once creation is complete, access the application and inspect its dashboard, quick links and appointment-related reports.

Zia AI Assistant Prompt

The instruction supplied to Zia describes a basic hospital application intended for a college practical. It asks the assistant to set up Admin, Doctor, Receptionist, Nurse and Pharmacist roles and apply appropriate access permissions.

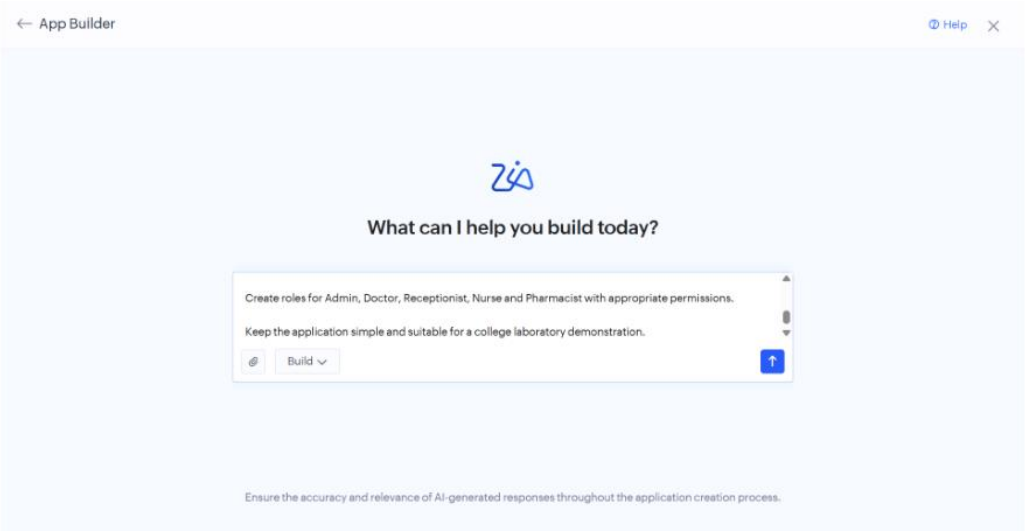

Figure 1: Prompt entered in the Zia AI Assistant.

Data Model and Hospital Use Cases

The builder outlines the main hospital use cases: registering patients, arranging appointments, allocating rooms, managing prescriptions and processing bills. It also provides a data model containing the entities and their corresponding attributes.

Zia-Generated Application Confirmation

Zia indicates that the requested application has been created successfully. The confirmation area lists the generated application sections, including use cases, components, permissions, blueprints and workflows.

Zia-Generated Application Confirmation

Zia confirms that the application has been created and provides access to the generated application. The builder also identifies application components such as permissions, blueprints and workflows.

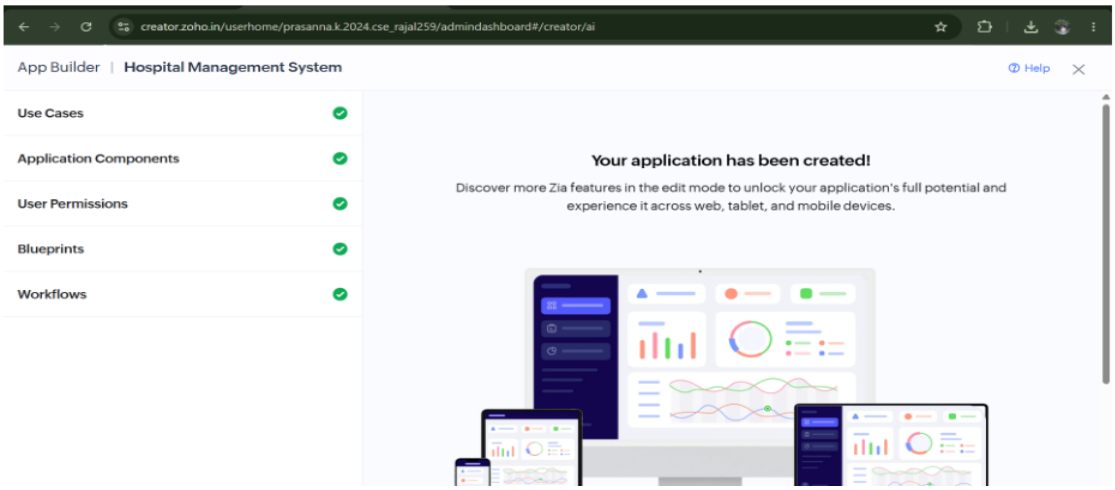

Figure 3: Confirmation displayed after application generation.

Accessing the Hospital Management System Dashboard

Selecting the access option opens the new Hospital Management System. The side menu links to its modules, and the dashboard area offers quick links together with charts for floor-wise charges and availability and a preview of appointment entries.

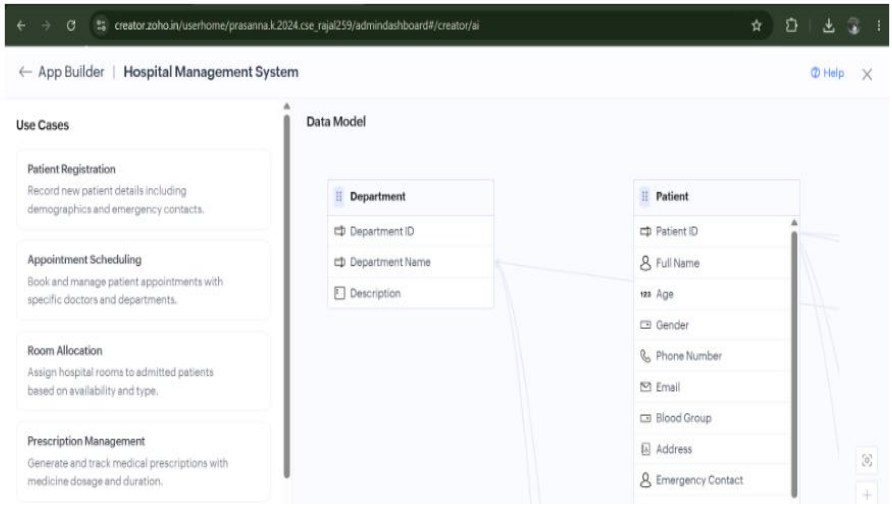

Figure 4: Generated Hospital Management System dashboard.

Dashboard Summary and Analytics

The dashboard gives a compact overview through summary cards and status counts. Additional quick links allow common records to be added, while charts visualise daily charges and room availability across floors.

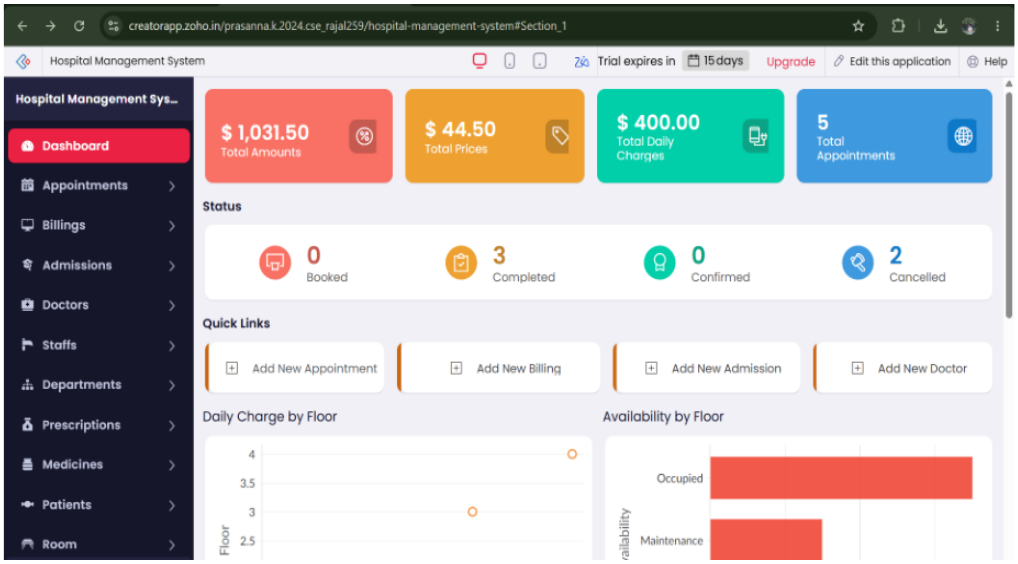

Figure 5: Summary cards, status indicators and dashboard charts.

Viewing the Complete Appointment List

The appointment list is a consolidated view of the bookings entered in the application. It displays the related patient and doctor details along with the department, scheduled date and time and the reason for the visit.

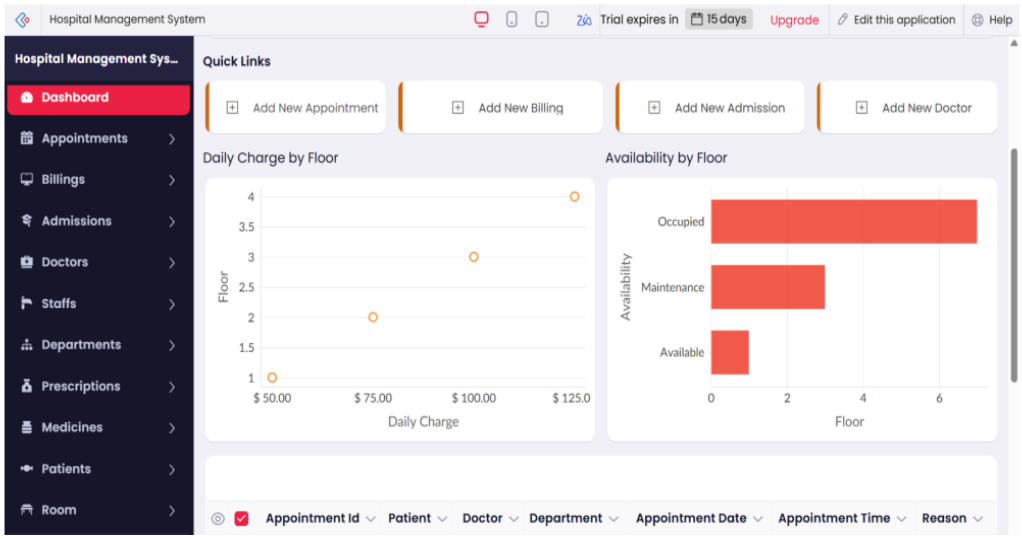

Figure 6: Complete list of appointment entries.

Viewing Appointment Records

The appointment records report arranges individual bookings into columns for doctor, department, date, time, visit reason and appointment status, making the entries easier to review.

Result

The Zia AI Assistant was used to generate the Hospital Management System in Zoho Creator. The generated result includes the requested hospital use cases and data structure, along with application components, dashboard analytics and appointment views.
