Vehicle Service Request Form

Advanced Fields — Step-by-Step Zoho Creator Report

Assignment 2 • Vehicle Service & Repair Request Management

Name	Shruti K
Roll No.	240701510
Application	Vehicle Service and Repair Request Management
Form	service_Request_form
Report	service_Request_form Report
Platform	Zoho Creator
Assignment	2 — Advanced Fields Extension

This assignment extends the Basic Fields implementation from Assignment 1 by adding the Advanced Fields specified for the Vehicle Service Request use case. The original form captured owner, contact, vehicle and issue information; the advanced version adds verification, service-history, media, cost, authorization and tracking capabilities.

Source basis: Assignment 1 supplied the existing Vehicle Service and Repair Request Management form and report, while the Advanced Fields lab specification defines the required extension and validation rules.

1. Aim

To extend the existing Vehicle Service and Repair Request Management application in Zoho Creator by incorporating all seventeen Advanced Field types into the existing service_Request_form, while retaining the Basic Fields already created in Assignment 1.

2. Problem Statement

The Assignment 1 version provides basic data capture for vehicle owners and service-centre staff. However, the basic form cannot verify a vehicle model against a master list, display service history in repeating rows, calculate a discounted payable amount, accept supporting media, capture digital authorization, or generate a unique service tracking reference.

The extended form therefore adds Advanced Fields for vehicle verification, service-history review, cost computation, media handling, authorization and automated tracking. The goal is to make the service request more useful across the repair workflow rather than simply storing contact and issue details.

3. Changes Made from Assignment 1

Assignment 1 — Existing	Assignment 2 — Extended
Basic fields for owner, contact, vehicle and issue details.	All existing Basic Fields retained, plus 17 Advanced Fields.
Manual vehicle/service information.	Vehicle Model Lookup connected to a master Vehicle Models form.
No repeating service history.	Previous_Service_History SubForm with repeating service records.
No automated cost calculation.	Estimated cost + discount + read-only Net_Service_Cost_Payable Formula.
No media/evidence support.	Image, File Upload, Audio and Video fields.
No digital authorization.	Owner_Digital_Signature field.
No unique tracking reference.	Auto Number Service_Request_ID and QR/Barcode tracking code.

4. Advanced Fields Used and Their Mapping

The following table maps the seventeen Advanced Field types from the supplied lab specification to the extended Vehicle Service Request Form.

Advanced Field	Form Field Name	Purpose	Sample / Behaviour
Decision Box	Requires_Pickup_Drop_Service	Captures whether pickup/drop service is required.	Yes / No toggle
Rich Text	Service_Center_Guidelines_Display	Displays formatted service-centre guidelines inside the form.	Drop-off and repair guidance
URL	Insurance_Policy_Portal_URL	Stores the owner's online motor-insurance policy link.	Insurance portal URL
Image	Vehicle_Damage_Photo	Captures a photo of the reported damage/fault.	damage_photo_02.jpg
Percent	Service_Discount_Percent	Stores the applicable service discount.	10%
Currency	Estimated_Service_Cost	Stores the estimated service/repair cost in INR.	■4,200.00
Decimal	Vehicle_Age_Years	Stores vehicle age for warranty/wear analysis.	3.5
Date-Time	Service_Request_Submitted_On	Records the exact submission date and time.	24-Jul-2026 07:30
SubForm	Previous_Service_History	Stores repeating previous-service date, type and cost rows.	Oil Change; Brake Pad Replacement
Lookup	Vehicle_Model_Lookup	Selects a vehicle model from the master Vehicle Models table and auto-fills service information.	Hyundai i20
Signature	Owner_Digital_Signature	Captures digital authorization for the estimated work.	Signed
File Upload	Insurance_Copy_Upload	Accepts a scanned insurance document for claim processing.	insurance_copy.pdf
Audio	Engine_Sound_Voice_Note	Optional recording of an unusual engine/brake sound.	engine_sound.mp3 (0:18)
Video	Vehicle_Issue_Video	Optional short video showing the reported issue.	issue_video.mp4 (0:40)
Auto Number	Service_Request_ID	Generates a unique sequential service request number.	SVC-REQ-2026-000691
Formula	Net_Service_Cost_Payable	Calculates payable cost after discount.	Cost – (Cost × Discount%)
QR/Barcode	Service_Tracking_QR_Code	Generates a scannable tracking code using the Service Request ID.	QR for SVC-REQ-2026-000691

5. Extended Form Layout (Section-wise)

Section A — Existing Owner Details

• Retain owner_name, Email and Address from Assignment 1.

Section B — Existing Contact Details

• Retain contact number and the existing communication-related fields.

Section C — Existing Vehicle & Issue Details

• Retain vehicle registration, Odometer_reading, vehicle_type, issue description, preferred service date/time, service type, additional services and service authorization as applicable.

Section D — Service Guidelines

• Service_Center_Guidelines_Display (Rich Text) provides instructions such as removing personal belongings and confirming estimates before repair work.

Section E — Vehicle Verification & Evidence

• Vehicle_Model_Lookup

• Vehicle_Damage_Photo

• Insurance_Copy_Upload

• Vehicle_Age_Years

Section F — Service History & Media Details

• Previous_Service_History

• Insurance_Policy_Portal_URL

• Vehicle_Issue_Video (optional)

• Engine_Sound_Voice_Note (optional)

Section G — Cost & Pickup Preference

• Requires_Pickup_Drop_Service

• Estimated_Service_Cost

• Service_Discount_Percent

• Net_Service_Cost_Payable (read-only)

Section H — Authorization & System Values

• Owner_Digital_Signature

• Service_Request_Submitted_On

• Service_Request_ID

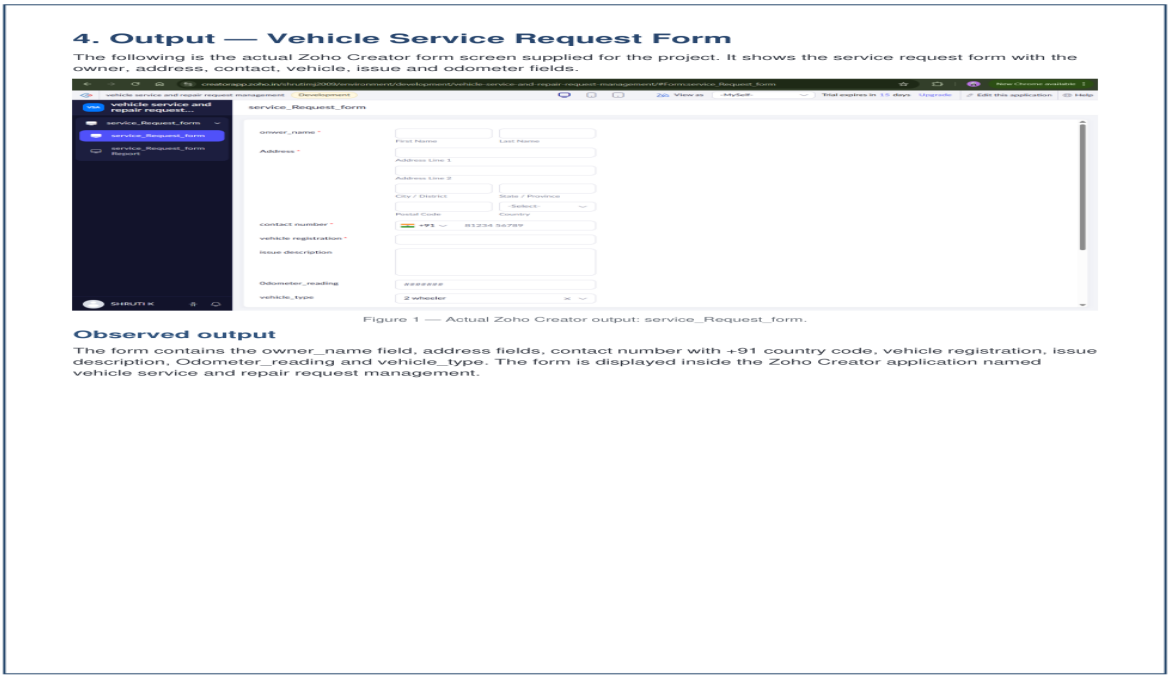

• Service_Tracking_QR_Code

The Advanced Fields are added to the existing form rather than replacing the Basic Fields. This preserves the original workflow while extending it for more realistic service-centre operations.

6. Existing Output from Assignment 1

The screenshots below are retained from Assignment 1 as the baseline output. They show the original Zoho Creator form and report before the Advanced Fields extension.

Figure 1 — Existing service_Request_form

The supplied Assignment 1 screenshot shows owner_name, address, contact number, vehicle registration, issue description, Odometer_reading and vehicle_type in the current form.

Figure 2 — Existing service_Request_form Report

The supplied report screenshot shows the submitted record in the service request report. Assignment 2 extends this report with advanced calculated and tracking values.

7. Validation & Configuration Rules

Field	Configuration / Validation
Vehicle_Model_Lookup	Connected to the master Vehicle Models form; staff select from type-ahead search instead of free text.
Previous_Service_History	Minimum 0 and maximum 10 repeating rows per vehicle.
Insurance_Copy_Upload	Accept PDF, JPG and PNG; maximum size 5 MB.
Vehicle_Damage_Photo	Accept JPG and PNG only; maximum size 2 MB.
Vehicle_Issue_Video	Maximum duration 45 seconds and maximum size 50 MB.
Service_Discount_Percent	Allowed range 0 to 25.
Estimated_Service_Cost	Non-negative values only; formatted in INR (■).
Net_Service_Cost_Payable	Read-only formula; recalculated whenever cost or discount changes.
Service_Request_ID	Prefix SVC-REQ-, current year, and 6-digit auto-incrementing sequence.
Service_Tracking_QR_Code	Auto-generated after Service_Request_ID is assigned on submission.
Owner_Digital_Signature	Mandatory before submission.
Requires_Pickup_Drop_Service	Mandatory Yes/No decision before submission.

8. Workflow Summary

Step 1: Owner completes the existing Basic Field sections for personal, contact, vehicle and issue details.

Step 2: Front office verifies the Vehicle Model using Lookup; standard service package and estimated duration are obtained from the master list.

Step 3: Previous service history is reviewed or entered in the SubForm for technician reference.

Step 4: Insurance copy and damage photo are uploaded; issue video and engine-sound voice note may be supplied when needed.

Step 5: Owner selects pickup/drop preference. Estimated cost and discount are entered, and the net payable amount is calculated automatically.

Step 6: Owner reads the service-centre guidelines and provides the digital signature.

Step 7: On submission, Zoho Creator generates the Service Request ID, records the submission timestamp and generates the QR tracking code.

Step 8: Service-centre staff use the extended report to review evidence, history, payable amount and the QR tracking reference.

9. Computed Logic

Net Service Cost Payable = Estimated_Service_Cost – (Estimated_Service_Cost × Service_Discount_Percent)

Example from the advanced-field specification: for an estimated service cost of ■4,200 and a 10% discount, the payable amount is ■3,780. The formula field is read-only and recalculates automatically when either input changes.

10. Expected Report Enhancements

• Retain the existing submitted service-request details.

• Add Service_Request_ID for unique identification.

• Show Net_Service_Cost_Payable as the computed amount.

• Show Service_Tracking_QR_Code for repair-stage tracking.

• Allow service-centre staff to review uploaded evidence and Previous_Service_History.

11. Testing Plan

Test Case	Expected Result
Owner name left empty	Mandatory validation prevents incomplete submission when configured.
Invalid/incomplete contact number	Phone validation rejects invalid input when configured.
Vehicle model selection	Lookup provides a valid model from the master list.
Insurance file above 5 MB	File upload validation rejects the oversized file.
Damage photo in unsupported format	Image validation rejects unsupported formats.
Discount below 0 or above 25	Percent validation prevents invalid discount values.
Negative estimated service cost	Currency validation prevents negative values.
No previous service records	SubForm permits 0 rows.
More than 10 service-history rows	SubForm prevents exceeding the configured maximum.
Missing digital signature	Submission is blocked because signature is mandatory.
Successful submission	Service Request ID, timestamp and QR tracking code are generated.
Cost/discount changed	Net payable formula recalculates automatically.

12. Result

The Assignment 1 Vehicle Service Request application is extended conceptually to an Advanced Edition by retaining the original Basic Fields and adding the seventeen Advanced Fields specified for the lab. The resulting design supports vehicle-model verification, service-history capture, evidence uploads, automatic cost calculation, digital authorization and service tracking.

13. Conclusion

Thus, the Vehicle Service and Repair Request Management system is enhanced in Zoho Creator from a basic data-entry form into a more complete service-centre workflow. The extension demonstrates how Advanced Fields can be combined with existing Basic Fields to support automation, computed values, structured lookups, multimedia evidence and trackable service requests.

14. Learning Outcomes

• Understand the purpose and use case of each Advanced Field in Zoho Creator.

• Configure Lookup fields for cross-form vehicle-model verification.

• Use SubForms for repeating service-history information.

• Use Formula and Auto Number fields for automation.

• Configure media and document fields with format and size restrictions.

• Use QR/Barcode fields for service tracking.

Note on screenshots: The supplied Assignment 1 PDF contains actual Zoho Creator screenshots for the original form and report, which are included in this document as baseline figures. The uploaded Advanced Fields specification describes the required advanced configuration, but it does not contain screenshots of the completed Advanced form. Therefore, no unverified Advanced-field screenshots have been fabricated.
